

1. Download and install [R](#) and then [RStudio](#). Then install some packages in R, using the following code.

```
install.packages(c("tidyverse", "ape")) # copy and paste this line
```

Here's an example of loading an R package,

```
library(tidyverse)
```

Ensure these two R packages are properly installed by loading each, very little should happen, but mainly no errors should occur.
